ParrotKit Purchase Success E2E Validation Report

Target URL: https://parrotkit-deploy.vercel.app/ | GTM version 3 published | Test time: 2026-03-11 19:55 KST

Executive Summary

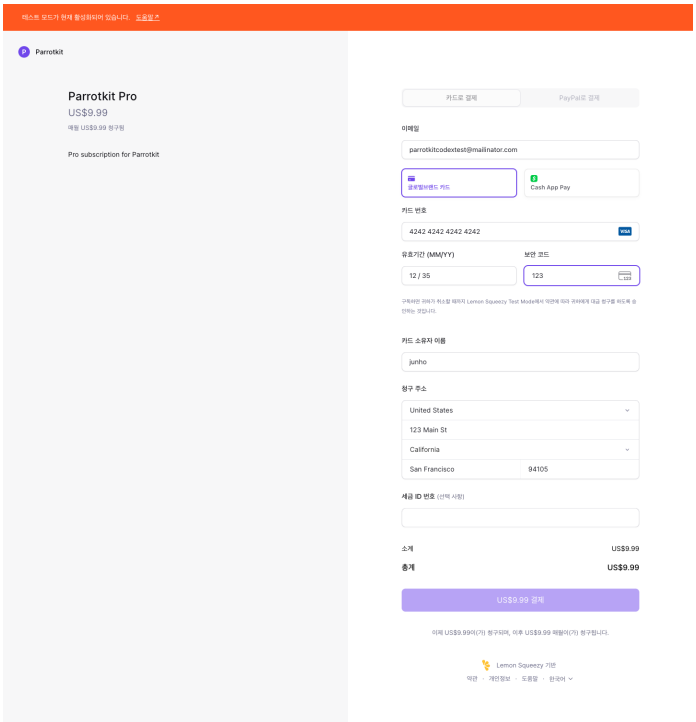
- Deploy checkout flow completed successfully in a headed browser session using the shared smoke-test account.
- After the GTM event-name fix, the GA4 collect request on /billing/success was observed with en=purchase_success.
- The previously broken legacy event names GA4-purchase_success and GA4 - purchase_success were not observed in this rerun.

Verification Scope

1. Sign in on /signin with the shared test account.
2. Navigate to /pricing and start hosted Lemon checkout.
3. Submit a test card payment and handle the Lemon success modal Continue action.
4. Return to /billing/success and /my, then inspect GA4 network requests for purchase_success.

Evidence Snapshot 1: Filled Checkout

The checkout form accepted the test card and valid billing address before payment submit.



Evidence Snapshot 2: Lemon Success Modal

The hosted checkout showed a thank-you state and the Continue button before returning to the app.

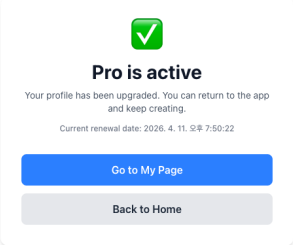
Evidence Snapshot 3: Billing Success

After clicking Continue, the flow returned to /billing/success on the app domain.



Network Findings

- POST /api/checkout returned 200 with variantId=1383129.
- POST to Lemon /checkout/submit returned 200.
- GA4 collect on the pricing page included en=view_pricing.
- GA4 collect on the billing success page included en=purchase_success.

Conclusion

The live GTM publish fixed the purchase event naming issue. The deploy E2E now closes the pricing funnel with the standard GA4 event name purchase_success.

Next actions: confirm the same event in GA4 DebugView, add Meta Pixel Purchase mapping, and finish the remaining minimum GA4 event set for signup and recipe flows.
