Parrotkit Deployment E2E Retest Report

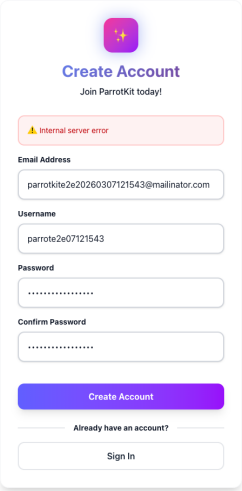
Target URL: https://parrotkit-deploy.vercel.app/ | Test window: 2026-03-07 21:15-21:20 KST

Executive Summary

- Fresh-account signup still fails on the deployed environment with HTTP 500.
- Existing-account login works.
- Reference submit, recipe generation, camera recording, and capture upload all passed in the deployed environment.
- Camera recording is the primary capture path and upload validation is part of that same flow.

Failure Path

Deployed signup remained on /signup and showed Internal server error after POST /api/auth/signup returned 500.

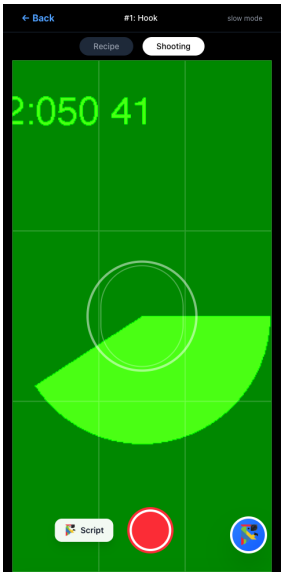


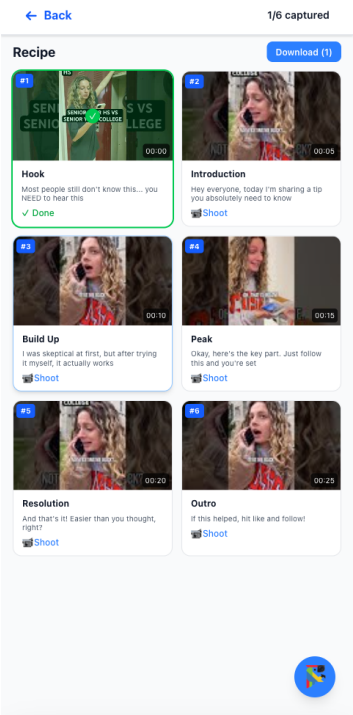
Working Path

- Login returned 200 for the shared smoke-test account.
- Reference analyze returned 200.
- Recipe save returned 201.
- Capture upload returned 200 for scene 1.

Camera Recording Flow

The deployed shooting tab opened with a camera preview, accepted a short recording, and uploaded the capture successfully.





Interpretation

The deployment is partially healthy. The blocking issue is still concentrated in signup, while the logged-in creator workflow is operational through recipe generation, camera recording, and capture upload.

Recommended Next Actions

1. Confirm the deployed site is actually running the latest commit that preserves sslmode=require for legacy DB connections.
2. Check Vercel function logs for /api/auth/signup after the latest deploy is live.
3. Re-run fresh-account signup immediately after that deploy.
4. Keep camera recording in the release checklist, but treat it as currently passing in deployment QA.

Conclusion: signup is still broken in the current deployed build, but the downstream logged-in creator flow is working.
